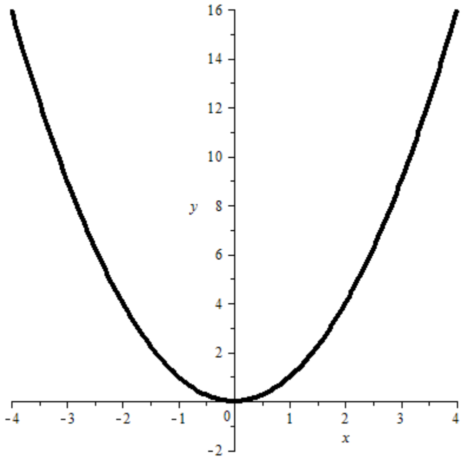
Quadratic function

Definition

f: D $\rightarrow$ $\mathbb{R}$	($D \subseteq \mathbb{R}$)
x $\mapsto$ y = f(x) = $ax^2 + bx + c$ general form	($a \in \mathbb{R}\setminus\{0\}$, $b \in \mathbb{R}$, $c \in \mathbb{R}$)
y = f(x) = $a(x - u)^2 + v$ vertex form	($a \in \mathbb{R}\setminus\{0\}$, $u \in \mathbb{R}$, $v \in \mathbb{R}$)

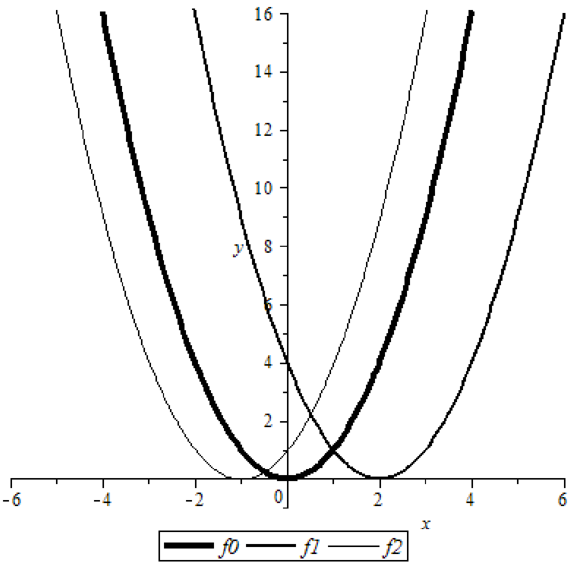
Graph

1. $y = f(x) = x^2$ (a = 1, u = 0, v = 0)



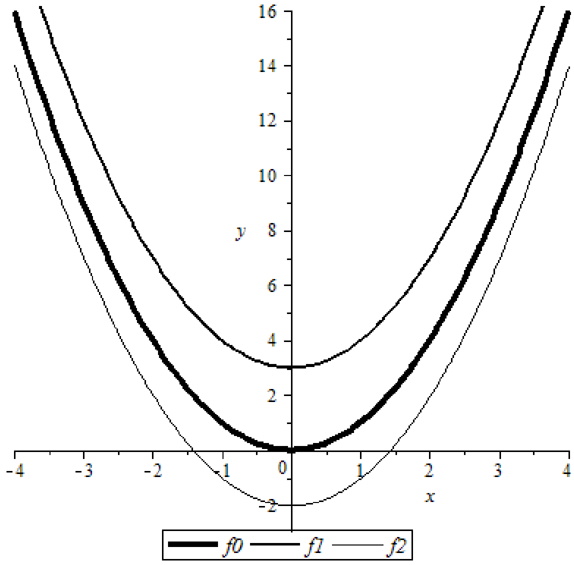
2. Parameter **u** (**u is varied**, a and v are kept constant)

$y = f_0(x) = x^2$ (a = 1, **u = 0**, v = 0)
$y = f_1(x) = (x - 2)^2$ (a = 1, **u = 2**, v = 0)
$y = f_2(x) = (x + 1)^2$ (a = 1, **u = -1**, v = 0)



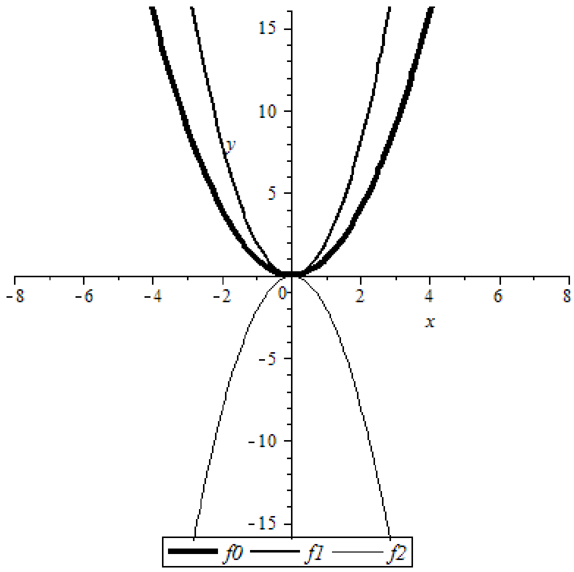
3. Parameter **v** (**v is varied**, a and u are kept constant)

$y = f_0(x) = x^2$ (a = 1, u = 0, **v = 0**)
$y = f_1(x) = x^2 + 3$ (a = 1, u = 0, **v = 3**)
$y = f_2(x) = x^2 - 2$ (a = 1, u = 0, **v = -2**)



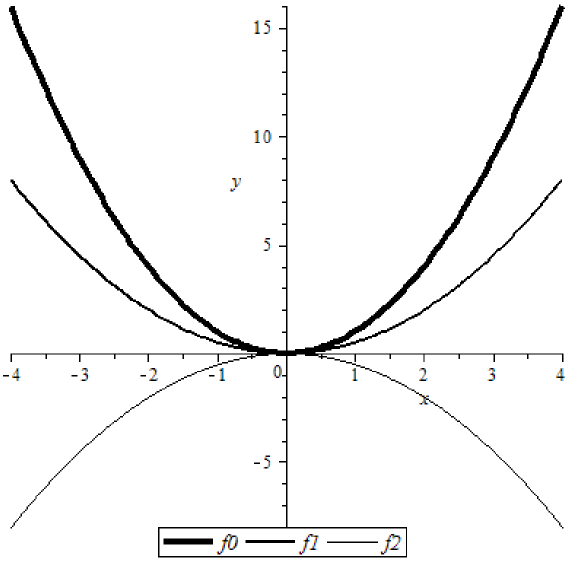
4. Parameter **a** (**a is varied**, u and v are kept constant)

$y = f_0(x) = x^2$ (**a = 1**, u = 0, v = 0)
$y = f_1(x) = 2x^2$ (**a = 2**, u = 0, v = 0)
$y = f_2(x) = -2x^2$ (**a = -2**, u = 0, v = 0)



5. Parameter **a** (**a is varied**, u and v are kept constant)

$y = f_0(x) = x^2$ (**a = 1**, u = 0, v = 0)
$y = f_1(x) = \frac{1}{2}x^2$ $\left(\mathbf{a = \frac{1}{2}}, u = 0, v = 0\right)$
$y = f_2(x) = -\frac{1}{2}x^2$ $\left(\mathbf{a = -\frac{1}{2}}, u = 0, v = 0\right)$

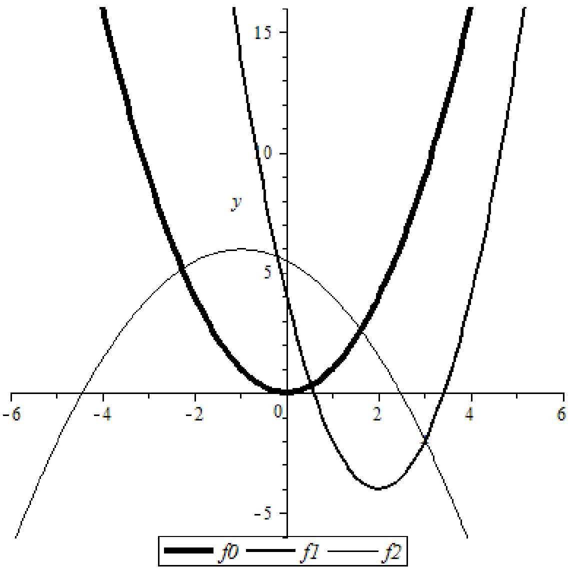


6. The **graph** of a quadratic function is a **parabola**.

The parameter **a** determines the **shape** of the parabola, and whether the parabola opens upwards or downwards.

The parameters **u** and **v** determine the **position** of the parabola. They are the coordinates of the **vertex** V of the parabola: V(u|v)

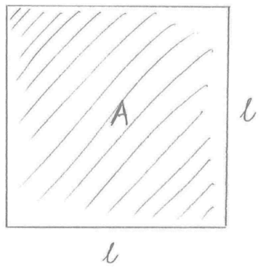
$y = f_0(x) = x^2$ (a = 1, u = 0, v = 0) V(0|0)
$y = f_1(x) = 2(x - 2)^2 - 4$ (a = 2, u = 2, v = -4) V(2|-4)
$y = f_2(x) = -\frac{1}{2}(x + 1)^2 + 6$ $\left(a = -\frac{1}{2}, u = -1, v = 6\right)$ V(-1|6)



Examples

1. Nature/Physics: Trajectories of water in a fountain

2. Geometry: Square

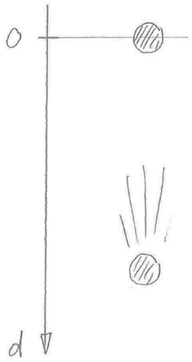


Area A at side length l: $A = l^2$

$f: \mathbb{R}^+ \to \mathbb{R}$

$l \mapsto A = f(l) = l^2$ quadratic function

3. Physics: Free fall



Distance d after time t: $d = \frac{1}{2}gt^2$ (g = gravity field strength)

$f: \mathbb{R} \to \mathbb{R}$

$t \mapsto d = f(t) = \frac{1}{2}gt^2$ quadratic function

4. Economics: Supply, Demand
