

Exercises 4 **Linear function and equations** **Linear function, simple interest, cost, revenue, profit, break-even**

Objectives

- be able to think of a relation between two quantities as a function.
- be able to determine the domain, the codomain, the range of a given function.
- be able to draw the graph of a given linear function.
- be able to determine slope and intercept of a linear function.
- know some examples of linear functions in economic and everyday life applications.
- know and understand the term "simple interest".
- be able to perform simple interest calculation.
- know and understand the terms "fixed costs", "variable costs", "total cost", "total revenue", "total profit" and "break-even value".
- be able to apply the concept of linear functions to a new problem.

Problems

4.1 A taxi driver charges the following fare:

8 CHF plus 1 CHF per kilometer

Think of the taxi fare as a function f .

- Determine the domain D , the codomain B , and the range E of the function.
- Draw the graph of the function f .

4.2 The taxi fare as described in problem 4.1 can be thought of as a linear function which assigns a fare y (in CHF) to each distance x (in km):

$$\begin{aligned} f: \mathbb{R}^+ &\rightarrow \mathbb{R}^+ \\ x &\rightarrow y = f(x) = ax + b \end{aligned}$$

Determine the values of a and b .

4.3 Find at least two more examples of linear functions in economics or in an everyday life context.

4.4 Graph the linear functions below, and determine both slope and intercept:

- $f: \mathbb{R} \rightarrow \mathbb{R}$
 $x \rightarrow y = f(x) = -2$
- $f: \mathbb{R} \rightarrow \mathbb{R}$
 $x \rightarrow y = f(x) = 3x - 4$
- $f: \mathbb{R} \rightarrow \mathbb{R}$
 $x \rightarrow y = f(x) = -x + 3$

4.5 Simple interest at a rate of 0.5% is paid on an initial bank balance of 5000 CHF.

- Determine the balance after ten years' time.
- Determine both slope and intercept of the corresponding linear function.

4.6 A mobile phone company offers three different tariffs:

- Tariff A: monthly basic fee of 10 CHF plus 0.20 CHF per minute
Tariff B: monthly basic fee of 25 CHF plus 0.10 CHF per minute
Tariff C: no basic fee, 0.60 CHF per minute

Think of the the three tariffs as linear functions.

- Draw the graphs of the three functions in one common coordinate system.
- Determine the total fee for each tariff for a monthly phone call duration of 1 hour.
- For what monthly phone call duration tariff A is cheaper than tariff C?
- For what monthly phone call duration tariff B is cheaper than tariff A?

4.7 (from: Bittinger, Ellenbogen: Calculus and its applications, Pearson 2007, ISBN 0-321-48543-2)

EXAMPLE 9 Business: Total Cost. Raggs, Ltd., a clothing firm, has **fixed costs** of \$10,000 per year. These costs, such as rent, maintenance, and so on, must be paid no matter how much the company produces. To produce x units of a certain kind of suit, it costs \$20 per suit (unit) in addition to the fixed costs. That is, the **variable costs** for producing x of these suits are $20x$ dollars. These costs are due to the amount produced and stem from items such as material, wages, fuel, and so on. The **total cost** $C(x)$ of producing x suits in a year is given by a function C :

$$C(x) = (\text{Variable costs}) + (\text{Fixed costs}) = 20x + 10,000.$$

- Graph the variable-cost, the fixed-cost, and the total-cost functions.
- What is the total cost of producing 100 suits? 400 suits?

4.8 (from: Bittinger, Ellenbogen: Calculus and its applications, Pearson 2007, ISBN 0-321-48543-2)

EXAMPLE 10 Business: Profit-and-Loss Analysis. When a business sells an item, it receives the *price* paid by the consumer (this is normally greater than the *cost* to the business of producing the item).

- The **total revenue** that a business receives is the product of the number of items sold and the price paid per item. Thus, if Raggs, Ltd., sells x suits at \$80 per suit, the total revenue $R(x)$, in dollars, is given by

$$R(x) = \text{Unit price} \cdot \text{Quantity sold} = 80x.$$

If $C(x) = 20x + 10,000$ (see Example 9), graph R and C using the same set of axes.

- The **total profit** that a business receives is the amount left after all costs have been subtracted from the total revenue. Thus, if $P(x)$ represents the total profit when x items are produced and sold, we have

$$P(x) = (\text{Total revenue}) - (\text{Total costs}) = R(x) - C(x).$$

Determine $P(x)$ and draw its graph using the same set of axes as was used for the graph in part (a).

- The company will *break even* at that value of x for which $P(x) = 0$ (that is, no profit and no loss). This is the point at which $R(x) = C(x)$. Find the **break-even value** of x .

Answers

4.1 a) $D = \mathbb{R}_0^+$ (distance/km)
 $B = \mathbb{R}_0^+$ (fare/CHF)
 $E = \{y \in \mathbb{R}_0^+ \mid y \geq 8\}$

b) ...

4.2 $a = 1, b = 8$

4.3 ...

4.4 a) Slope $a = 0$, intercept $b = -2$

b) Slope $a = 3$, intercept $b = -4$

c) Slope $a = -1$, intercept $b = 3$

4.5 a) 5250 CHF

b) $f: \mathbb{R}_0^+ \rightarrow \mathbb{R}_0^+$
 $x \rightarrow y = f(x) = ax + b$

Slope $a = 25$, intercept $b = 5000$

4.6 a) Tariff A: $A: \mathbb{R}_0^+ \rightarrow \mathbb{R}_0^+$
 $x \rightarrow y = A(x) = 0.2x + 10$

Tariff B: $B: \mathbb{R}_0^+ \rightarrow \mathbb{R}_0^+$
 $x \rightarrow y = B(x) = 0.1x + 25$

Tariff C: $C: \mathbb{R}_0^+ \rightarrow \mathbb{R}_0^+$
 $x \rightarrow y = C(x) = 0.6x$

Direct proportionality: fee y is direct proportional to phone call duration x .

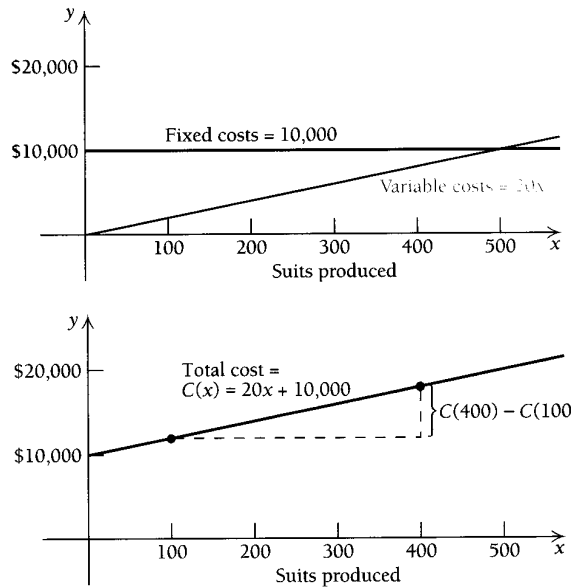

b) Tariff A: 22 CHF
 Tariff B: 31 CHF
 Tariff C: 36 CHF

c) over 25 min

d) over 150 min

4.7

- a) The variable-cost and fixed-cost functions appear in the graph on the left below. The total-cost function is shown in the graph on the right. From a practical standpoint, the domains of these functions are nonnegative integers 0, 1, 2, 3, and so on, since it does not make sense to make either a negative number or a fractional number of suits. It is common practice to draw the graphs as though the domains were the entire set of nonnegative real numbers.

- b) The total cost of producing 100 suits is

$$C(100) = 20 \cdot 100 + 10,000 = \$12,000.$$

The total cost of producing 400 suits is

$$\begin{aligned} C(400) &= 20 \cdot 400 + 10,000 \\ &= \$18,000. \end{aligned}$$

4.8 (see page 5)

4.8

- a) The graphs of $R(x) = 80x$ and $C(x) = 20x + 10,000$ are shown below. When $C(x)$ is above $R(x)$, a loss will occur. This is shown by the region shaded red. When $R(x)$ is above $C(x)$, a gain will occur. This is shown by the region shaded gray.

- b) To find P , the profit function, we have

$$\begin{aligned} P(x) &= R(x) - C(x) = 80x - (20x + 10,000) \\ &= 60x - 10,000. \end{aligned}$$

The graph of $P(x)$ is shown by the heavy line. The red portion of the line shows a “negative” profit, or loss. The black portion of the heavy line shows a “positive” profit, or gain.

- c) To find the break-even value, we solve $R(x) = C(x)$:

$$\begin{aligned} R(x) &= C(x) \\ 80x &= 20x + 10,000 \\ 60x &= 10,000 \\ x &= 166\frac{2}{3}. \end{aligned}$$

How do we interpret the fractional answer, since it is not possible to produce $\frac{2}{3}$ of a suit? We simply round to 167. Estimates of break-even values are usually sufficient since companies want to operate well away from break-even values in order to maximize profit. ♦
